SAMPLE EDITION OVERVIEW

Industrial Gearbox Lead-Time Index: New vs. Rebuild

DESIGN DEMO: All index statistics below are synthetic. Do not cite these figures as actual Industrial Gearbox Service results or industry statistics. Replace them with reviewed, permission-cleared records before publication.

ILLUSTRATIVE LEAD FINDING

22 weeks new-unit quote median vs. **9 weeks** rebuild median

Difference between sample medians: 13 weeks. These are separate, unpaired groups, not equivalent proposals for the same gearbox.

<1 week

Emergency rebuild service capability
The business owner states that some emergency rebuilds can be completed in less than one week. This is separate from the synthetic routine-rebuild sample. Actual timing depends on findings, repair scope, parts, approvals, and scheduling.

ILLUSTRATIVE CLASS SUMMARIES - WEEKS

Gearbox	OEM n	New unit median / IQR / range	Rebuild n	Rebuild median / IQR / range
Helical	6	22 / 1.5 / 18-30	5	8 / 2 / 6-11
Planetary	4	27 / 9 / 18-36	3	12 / 3 / 9-15
Worm	5	16 / 5 / 12-20	4	7 / 2.5 / 5-9
Bevel	3	24 / 6 / 18-30	4	10 / 3 / 7-13

IQR is Q3 minus Q1; range is minimum to maximum. Quartiles use inclusive linear interpolation (Type 7). Counts are deliberately small in this synthetic example.

WHAT THE SAMPLE CAN AND CANNOT SAY

The synthetic rows show a 15-week median gap for planetary and a 9-week gap for worm. They do not prove that rebuild is technically suitable, faster, or less expensive for any specific unit. Emergency rebuild work is reported separately from routine jobs.

ARTWORK CLAIMS TO VERIFY BEFORE PUBLICATION

The supplied infographic also says 24-72 hours, standard rebuild under one week, up to 21+ weeks saved, and up to 99% less downtime. These claims are not established by the synthetic dataset or the owner statement in this preview. Correct or substantiate them before public use.

METHOD, INTERPRETATION AND MEDIA USE

How to read this sample

PROPOSED DEFINITIONS

OEM QUOTE LEAD TIME

Quote date to quoted shipment-ready date. A real edition must distinguish shipment from delivery and state freight treatment.

REBUILD TURNAROUND

Shop receipt to tested and ready-to-ship. This does not mean delivered, installed, or returned to service.

EMERGENCY REBUILD

The owner states some emergency rebuilds can be completed in less than one week. Do not merge this capability into routine turnaround statistics.

ELIGIBILITY

Use dated, identifiable gearbox classes and unique quote configurations; rebuild jobs need documented receipt and completion timestamps. Exclude duplicates, cancellations, incomplete jobs, and missing dates.

COVERAGE

Publish actual geography, class coverage, size range, horsepower/torque scope, date window, counts, and exclusions. Do not invent cutoffs.

STATISTICS

Report median, n, IQR, and min-max range. Fix one quartile method before analysis; flag small groups and avoid unsupported comparisons.

PRIVACY AND REVIEW

Remove customer, plant, serial, supplier, and quote identifiers. Reconcile page, chart, CSV, and PDF against one reviewed dataset.

RELEASE CADENCE AND LIMITATIONS

Proposed cadence: target the second Tuesday after quarter-end, but publish only after data-quality and privacy review is complete. Delay if review gates are not met. A live edition should show its dates, methodology version, accountable reviewer, and archive URL.

This index would describe only documented records in a given release, not the whole gearbox market. Individual schedules depend on configuration, inspection findings, repair scope, parts, approvals, testing, transport, and shop scheduling.

SOURCE CONTEXT AND SAMPLE CITATION

Published vendor examples are background context only and are not blended into this synthetic sample: Philadelphia Gear, philagear.com/knowledge-center/spare-gearboxes; Sumitomo Drive Technologies, us.sumitomodrive.com.

Suggested citation: Industrial Gearbox Service. “Quarterly Industrial Gearbox Lead-Time Index - sample design preview.” Synthetic demonstration values only; not a published data edition.
